Nielsen Heuristic Evaluation - Personalized Study Planner

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
1	H1-1: Simple & natural dialog	Some UI sections (e.g., dashboard cards and filters) feel slightly cluttered and not optimally organized for first-time users.		1	Simplify layout by grouping related elements and reducing unnecessary visual elements.
2	H1-2: Match between system and real world	The event types (Class, Exam, Other) are too generic and may not reflect real study situations.		1	Use more meaningful labels such as "Study session", "Deadline", etc.
3	H1-3: Minimize users' memory load	When there are no tasks, the dashboard only shows "No tasks yet..." without guiding users on what to do next.		2	Add a clear CTA button such as "Create your first task".
4	H1-3: Minimize users' memory load	The calendar does not display weekday labels (Mon, Tue, etc.), making it harder to interpret dates.		2	Add a row showing the days of the week.
5	H1-4: Consistency and standards	There are two ways to create tasks ("+ New Task" and AI button), but the AI button has no label, which may confuse users.		2	Add a tooltip or label such as "AI Task Generator".
6	H1-4: Consistency and standards	In the Profile page, both "Name" and "First Name / Last Name" fields are present, causing redundancy.		2	Use either full name or separated fields, not both.
7	H1-5: Feedback	After adding an event, there is no confirmation message indicating success.		1	Display a toast message such as "Event added successfully".

No	Heuristic	Description of the Issue	Screenshot	Severity	Suggested Improvement
8	H1-5: Feedback	After clicking "Save" in the Profile page, there is no clear indication whether the changes were saved successfully.		2	Add a success or error message after saving changes.
9	H1-6: Clearly marked exits	The modal includes a Close button but does not have a standard "X" icon at the top-right corner.		1	Add a close (X) icon at the top-right corner.
10	H1-7: Shortcuts	The system does not provide shortcuts or quick actions (e.g., keyboard shortcuts or quick-add features) for experienced users.		1	Add quick actions such as “Quick Add Task” or keyboard shortcuts for faster interaction.
11	H1-8: Precise & constructive error messages	Error messages (e.g., JSON/CORS errors) are technical and not user-friendly, making it hard for users to understand what went wrong.		2	Replace technical error messages with clear, user-friendly messages such as “Sign up failed, please try again”.
12	H1-9: Prevent errors	The event creation form does not clearly indicate required fields, which may lead to incomplete submissions.		3	Mark required fields and add validation before submission.
13	H1-10: Help and documentation	The AI input field asks "What do you want to learn?" but does not provide any example input.		2	Add a placeholder example such as "e.g., Learn Java in 2 weeks".
